Executive Summary

Greater Essex District School Board retained Waste Reduction Group ("WRG") to conduct a solid, non-hazardous waste audit for the Beacon Heights Public School located at 13800 Tecumseh Rd in Tecumseh, Ontario (the Site). The audit complied with the Environmental Protection Act, O.Reg. 102/94: Waste Audits and Waste Reduction Work Plans, and O.Reg.103/94: Industrial, Commercial, and Institutional Source Separation Program.

The objectives of the audit were to determine the composition of the garbage and recycling streams by point of origin, quantify Beacon Heights Public School's estimated 2025 annual waste generation, determine the waste diversion and capture rates, identify additional opportunities for waste reduction and diversion, and address any specific concerns identified during the study.

The scope of the waste audit included collecting one (1) sample of the Red Box stream, one (1) sample of the Blue Box stream and five (5) samples of the Garbage stream.

Findings and Conclusions

The conclusions discussed below are based on the waste audit findings. It should be noted that the conclusions and recommendations presented in this report are based on the waste audit sample results, which are considered representative of the annual quantities reported in this document. The estimates in this report do not account for fluctuations in daily waste quantities.

Sample Composition

- The Garbage stream sample had the highest sample mass (76.50%), followed by Red Box (13.76%) and Blue Box stream (9.74%).

Composition By Waste Stream

- **Garbage Stream** - the garbage stream consisted primarily of organics (11.43 kg, 33.22%), paper towels/compostable fibres (6.85 kg, 19.91%), and fine paper (3.88 kg, 11.28%).
- **Red Box** - Fine paper had the greatest overall sample mass (3.02 kg, 48.79%), followed by boxboard (1.23 kg, 19.87%) and LDPE #4 plastic films (1.03 kg, 16.64%).
- **Blue Box** - consisted primarily of LDPE #4 plastic films (1.29 kg, 29.45%), PET #1 (0.54 kg, 12.33%), and aluminum (0.48 kg, 10.96%).

Composition by Functional Area

- **Classrooms** generated the highest overall proportion of the sample mass (55.74%), with the garbage stream consisting primarily of organics, paper towels/compostable fibres and non-recyclables.
- **Hallways/general areas** represented the second-highest sample mass (23.50%) of the Red Box and Blue Box streams, composed primarily of fine paper, LDPE #4 plastic films, and boxboard.

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

Contamination

- The contamination rates for the sampled streams were as follows: Garbage stream – 26.21%, and overall Recycling stream – 23.65%. The contamination rates for the Red Box and Blue Box streams were 23.59% and 39.27%, respectively.
- The **Red Box** sample consisted of 76.41% Red Box material, 19.55% Garbage material and 4.04% Blue Box material.
- The **Blue Box** sample consisted of 60.73% Blue Box material, 29.45% garbage material and 9.82% Red Box material.
- The **garbage sample** consisted of 73.79% garbage material, 15.72% Red Box material, and 10.49% Blue Box material.

Recyclables in the Garbage Stream

- The garbage sample consisted of 12.38% Mandatory Recyclables, 12.18% Other Recyclables, and 75.44% Other (Non-Recyclable) material.
- The **Mandatory Recyclables** in the garbage stream consisted of (in % of total sample mass):
    - Fine paper – 45.92%
    - Aluminum – 4.50%
- The **Other Recyclables** in the garbage stream consisted primarily of:
    - Polystyrene #6 – 7.57%
    - HDPE #2 containers – 7.46%
    - Aseptic containers – 7.22%
    - Boxboard – 6.51%
    - PET #1 – 5.80%

- The 2025 **waste diversion rate was calculated to be 23.50%** (below the provincial objective of 60%) based on 2.05 MT of potential diverted waste and 8.73 MT of total waste generated in 194 school days.
- The overall **capture rate was calculated at 43.24%**, based on an estimated diverted quantity of 1.43 MT and a total potential divertible quantity of 3.32 MT. The overall recycling capture rate was 43.24%, with the Red Box and Blue Box capture rates calculated at 44.75% and 40.80%, respectively.

Recommendations

- Improving the existing recycling program would reduce the presence of mandatory recyclables in the garbage stream and result in measurable increases in waste diversion and capture rates. Based on audit findings, the following materials present the greatest diversion potential:
    - *Fine paper:* An estimated 0.75 MT of fine paper is disposed of annually through the garbage stream. Redirecting this material to the recycling stream could increase the overall waste diversion rate by up to 6.05% and improve the capture rate by up to 22.62%.
    - *Aluminum:* Approximately 0.07 MT of aluminum is estimated to be disposed of annually in the garbage stream. Diverting this material through proper recycling could increase the waste diversion rate by up to 0.61% and the capture rate by up to 2.11%.

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

- Implementing enhanced waste diversion programs, including the source separation of organics and paper towels/compostable fibres through the installation of dedicated receptacles in key generation areas (e.g., classrooms, hallways, kitchens, and cafeterias), would significantly improve waste diversion and capture rates. Based on audit results, the following diversion opportunities were identified:
    - *Organics:* Approximately 2.24 MT of organic material is disposed of annually through the garbage stream. Diverting this material through a dedicated organics diversion program could increase the overall waste diversion rate by up to 15.63%.
    - *Paper towels/compostable fibres:* An estimated 1.34 MT of paper towels and compostable fibre materials are disposed of annually through the garbage stream. Diverting these materials through an organics diversion program could increase the waste diversion rate by up to 10.18%.
- Providing clear signage with pictures/graphics to help staff and students identify opportunities for proper disposal at the source should improve capture rates. This can include signage with pictures to help staff and students identify their waste. Dedicated receptacles as part of a collection program should be made available at each disposal location to help staff and students dispose of their waste accordingly at the source and include colour coordination to identify the type of waste (i.e., green for organics/compost, blue for recycling, black for garbage). Receptacles should be sized accordingly based on the type of activity or use.
- Promote a culture of waste diversion with the staff and students through education on its importance and communication of the municipal goals for waste diversion and sustainability. Create a positive message around the benefits of waste diversion and the role that the individual/family plays.
- Waste generated from single-use items such as coffee cups and coffee pods can be reduced by encouraging staff to bring personal mugs and implementing the purchase of coffee pods that are part of a collection and recycling program.
- Set achievable goals and metrics, track year-over-year changes in waste diversion and communicate progress to the community to encourage further participation/engagement.

1. Introduction

Greater Essex District School Board retained Waste Reduction Group ("WRG") to conduct a solid, non-hazardous waste audit for Beacon Heights Public School located at 13800 Tecumseh Rd in Tecumseh, Ontario (the Site). The audit complied with the Environmental Protection Act, O.Reg. 102/94: Waste Audits and Waste Reduction Work Plans, and O.Reg. 103/94: Industrial, Commercial, and Institutional Source Separation Program.

1.1 Purpose and Objectives

The purpose of the waste audit was to comply with Ontario Regulation 102/94 – Waste Audits and Waste Reduction Work Plans Part XI, which requires educational institutions to conduct a waste audit covering the waste generated by the establishment operating at the site and prepare and implement a waste reduction work plan on an annual basis to confirm compliance with Ontario Regulation 103/94 – IC&I Source Separation Programs.

The objectives are as follows:

- Determine the composition of the Red Box, Blue Box and Garbage streams by point of origin,
- Quantify the estimated 2025 annual waste generation for all waste streams based on audit data and the number of days in the school year,
- Determine the waste diversion and capture rates,
- Identify additional opportunities for waste reduction and diversion; and
- Address any specific concerns identified during the study.

The Site is considered to apply to O.Reg.103/94 – Educational Institutions.

1.2 Site Description

Beacon Heights Public School, located at 13800 Tecumseh Rd, Tecumseh, Ontario, N8N 2K1, is a public educational institution serving approximately 609 students. The school provides education from Junior Kindergarten through grade 8 and includes functional areas such as classrooms, hallways, offices, staff rooms, and washrooms. Waste collection within the facility is organized by waste stream and corresponds to distinct areas of waste generation. The site is subject to Ontario Regulation 103/94 (Educational Institutions).

2. Scope of Work

To meet the objectives outlined above, the following activities were undertaken by WRG:

- Collected one (1) sample of the Red Box stream, one (1) sample of the Blue Box stream and five (5) samples of the Garbage stream.
- Sorted samples into predetermined categories as set out by WRG (detailed in Appendix A:

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

List of Categories).

- Determined the total quantity of waste diverted from landfill through current reduction, reuse, and recycling programs implemented at the school. Quantities were calculated using sample mass multiplied by the number of school days per year;
- Completed a waste audit report summarizing the audit findings and provided recommendations for increased waste diversion efficiency.
- Conducted a site tour accompanied by site personnel and interviewed staff to obtain information on existing waste diversion practices.

3. Sampling Methodology

On November 26, 2025, WRG collected one (1) sample of the Red Box stream, one (1) sample of the Blue Box stream and five (5) samples of the Garbage stream from various waste generation areas—including classrooms, hallways and general areas, public areas, offices, the staff room, and washrooms—over a 24-hour period. Each sample comprised source-separated waste materials generated by staff, students, and visitors within the identified indoor areas.

Qualified WRG staff sorted the materials using containers to keep them separate. Waste was sorted into individual material categories and weighed using a calibrated scale (Appendix B: Scale Calibration Certificate). It was then re-bagged and disposed of in an appropriate waste container.

4. Waste Audit Findings

The overall results observed for Beacon Heights Public School are presented in Table 1 and Figure 1. The sample comprised a total of 44.98 kg of waste materials collected and sorted during the waste audit. Approximately 76.50% of the sample originated from garbage, 13.76% from the Red Box stream, and 9.74% from the Blue Box stream. The following sections provide an analysis of each waste stream sample.

4.1 Overall Sample Composition and Contamination

The following samples from the waste streams were collected and sorted. Table 1 below illustrates the total waste collected per area.

Notable observations are described below:

- Classrooms accounted for the largest proportion of the sample, contributing 25.07 kg (55.74% of the total sample mass). This was followed by hallways and general areas, which accounted for 23.50% of the total sample mass, with the largest contribution from the Red Box stream (13.76%). The office had the lowest distribution, with 2.96% of garbage.

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

Notable observations are described below:

- **Classroom (Garbage)** - generated the highest sample mass (55.74% of total sample), which consisted primarily of organics, paper towels/compostable fibres, non-recyclables, and LDPE #4 plastic films.
- **Hallways/general areas (Red Box and Blue Box)** - generated the second highest mass, accounting for 23.50% of the total sample mass, and consisted primarily of fine paper, LDPE #4 plastic films and boxboard.
- **Public areas (Garbage)** - generated 8.65% of the total sample mass and consisted of fine paper and non-recyclables.
- **Staff room (Garbage) -** generated 4.82% of the total sample mass and consisted primarily of paper towels/compostable fibres and organics.
- **Washroom (Garbage)** - generated 4.34% of the total sample mass and consisted mainly of paper towels/compostable fibres.
- **Office (Garbage)** - generated 2.96% of the total sample mass and consisted primarily of other plastics #3, #4, #7 and fine paper.
- Overall, organics, fine paper, paper towels/compostable fibres and LDPE #4 plastic films were the most generated materials across all areas and waste streams, collectively accounting for roughly 69% of the total sample mass.

The contamination rates for the sampled waste streams are presented in Figure 1, which illustrates the contamination rate for each waste stream individually. Percentages are calculated by row, indicating the proportion of each waste stream sample that was contaminated versus non-contaminated.
The garbage stream exhibited a contamination rate of 26.21%, while the overall recycling stream showed a contamination rate of 23.65%. Within the recycling streams, the Red Box and Blue Box exhibited contamination rates of 23.59% and 39.27%, respectively.

Figure 1: Contamination Rate by Sampled Stream

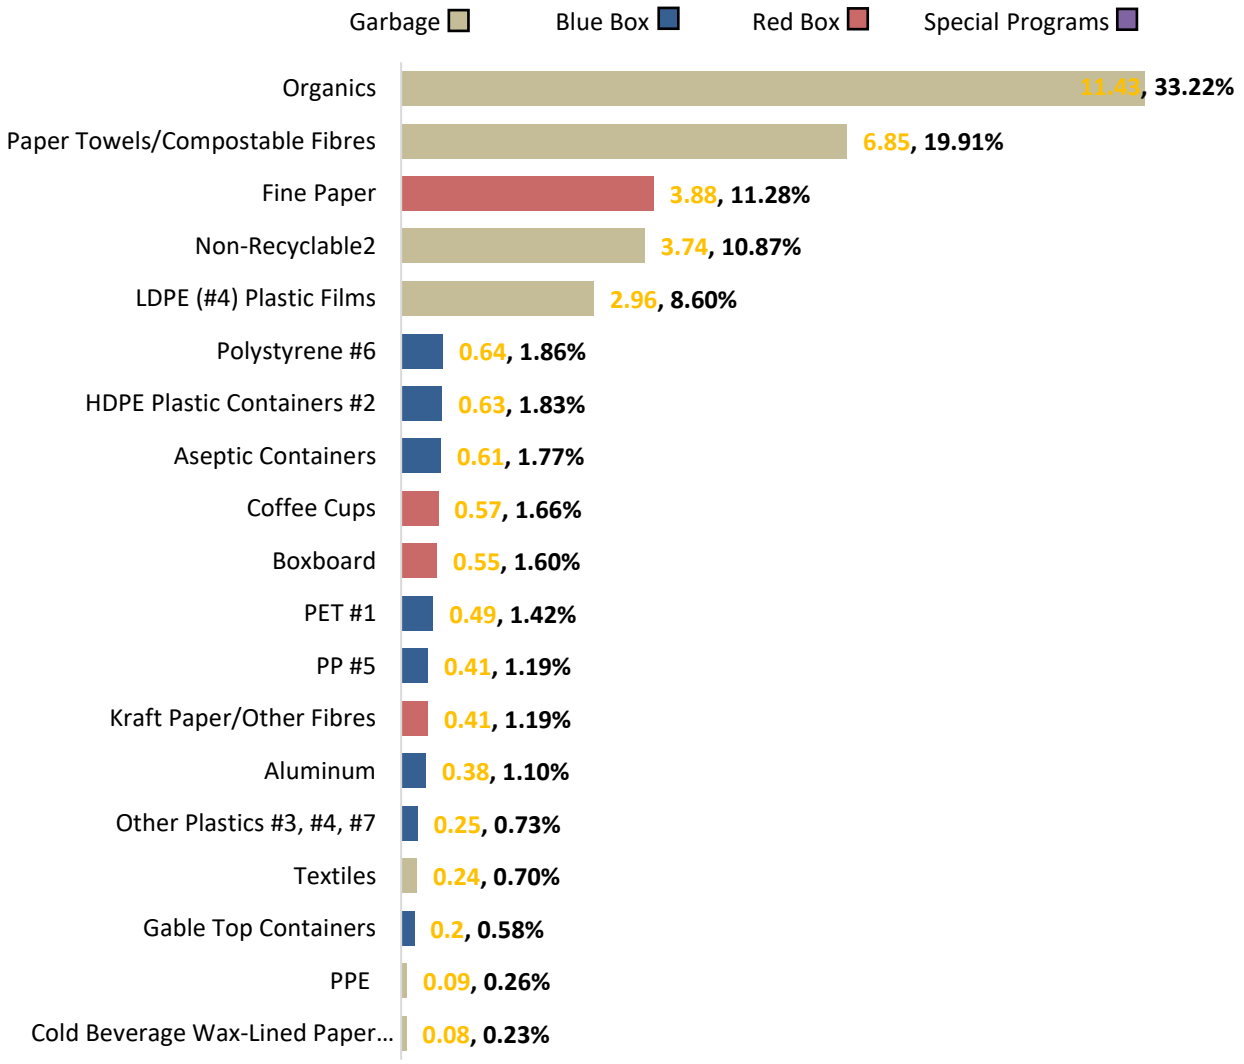

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

4.2 Garbage Sample Composition and Contamination

A total of 34.41 kg of garbage was collected and sorted during the audit, representing 76.50% of the overall sample mass. The largest portion originated from the classrooms, accounting for 25.07 kg (55.74%) of the total sample mass. This was followed by public areas with 3.89 kg (8.65%) (Table 1). A detailed breakdown of the sample by material category is presented in Figure 2, and the corresponding sample contamination by generation area is illustrated in Figure 3.

Figure 2: Garbage Sample Composition by Material (in kg and % of sample by mass)

Notable Observations

- The garbage sample was primarily composed of **organics**, which accounted for 33.22% (11.43 kg) of the total weight, followed by **Paper towels/compostable fibres** (19.91%), and **fine paper** (11.28%) (Figure 2).
- The remaining 35.60% consisted mainly of non-recyclables, LDPE #4 plastic films, mixed

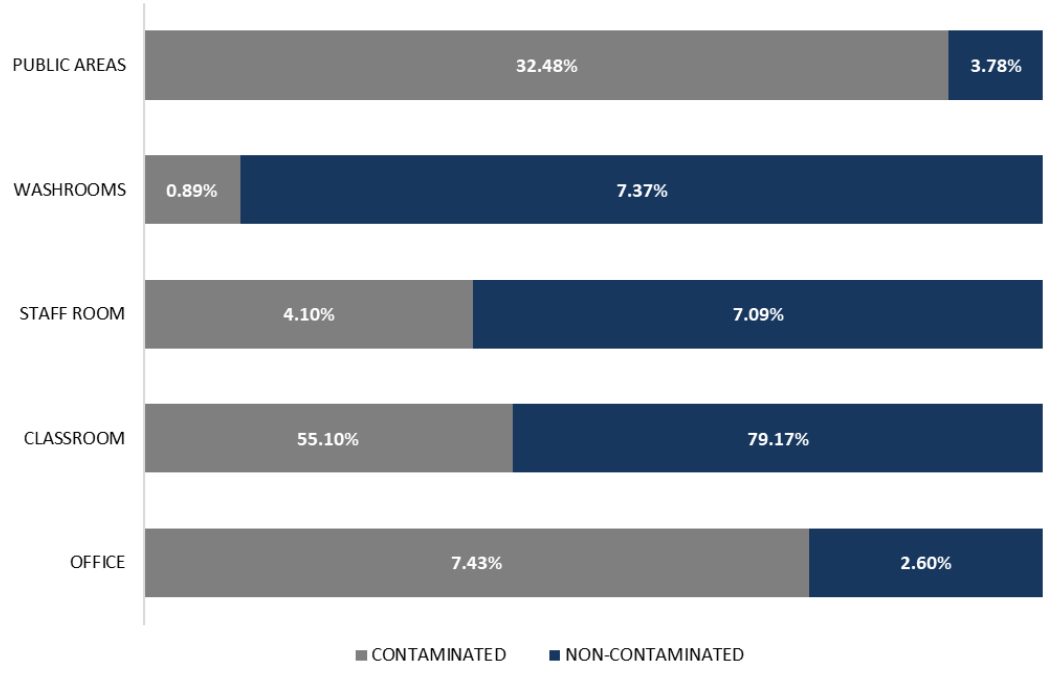

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

containers (polystyrene #6, HDPE #2 containers, aseptic containers, PET #1, PP #5), coffee cups, boxboard, and kraft paper (Figure 2).

- The garbage sample consisted of 73.79% garbage material, 15.72% Red Box material, and 10.49% Blue Box material (Figure 2).

Figure 3 below is designed to compare contamination levels across the different generation areas and to identify the areas with the highest contamination. For this purpose, percentages are calculated by column, allowing comparison of each generation area within the "contaminated" and "non-contaminated" categories. As a result, the percentages sum to 100% vertically, enabling comparison of the distribution of contamination across all generation areas.

Figure 3: Contamination by Garbage Sample and Generation Area

Notable Observations

- The contamination rate for the sampled garbage stream was 26.21%.
- The sample consisted of contamination of Red Box material (15.72%) and Blue Box material (10.49%); the contamination was high in fine paper, mixed containers (polystyrene #6, HDPE #2 containers, aseptic containers, PP #5 and PET #1 containers), coffee cups and boxboard.
- The garbage sample showed that Classrooms (55.10%) were the most contaminated among all generation areas. The contamination consisted primarily of fine paper, boxboard and polystyrene #6. The washrooms showed the lowest contamination at 0.89%.

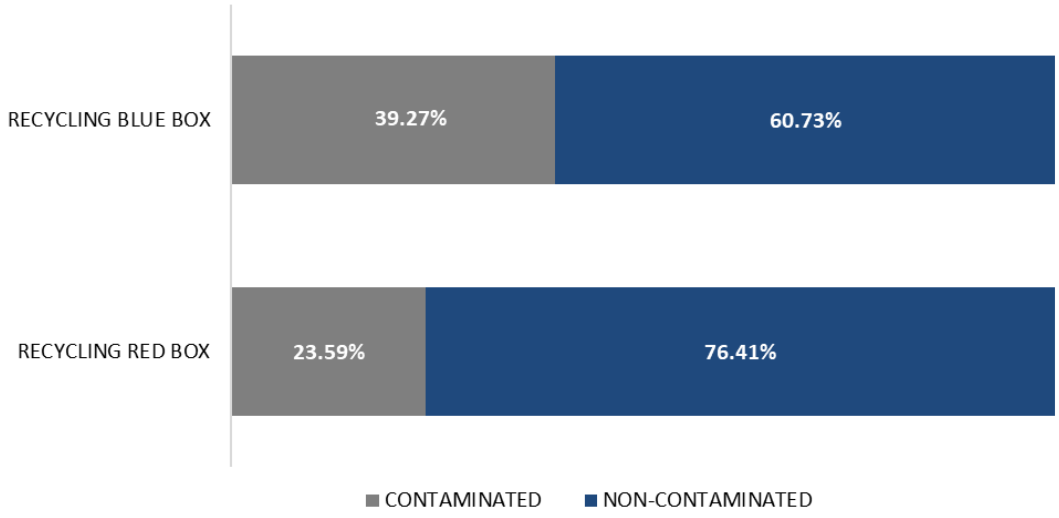

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

4.3 Recycling Composition and Contamination

In total, 10.57 kg of recyclable materials were collected and sorted during the audit, of which 6.19 kg (13.76%) corresponded to Red Box materials and 4.38 kg (9.74%) to Blue Box materials. The overall contamination rate for the recycling stream was calculated at 23.65% (Figure 1).

Figure 4 below presents the contamination rates for both recycling streams assessed individually, with percentages calculated by row to show the proportion of contaminated versus non-contaminated material within each stream. The Red Box and Blue Box streams exhibited contamination rates of 23.59% and 39.27%, respectively.

Figure 4: Contamination Rate Recycling Stream

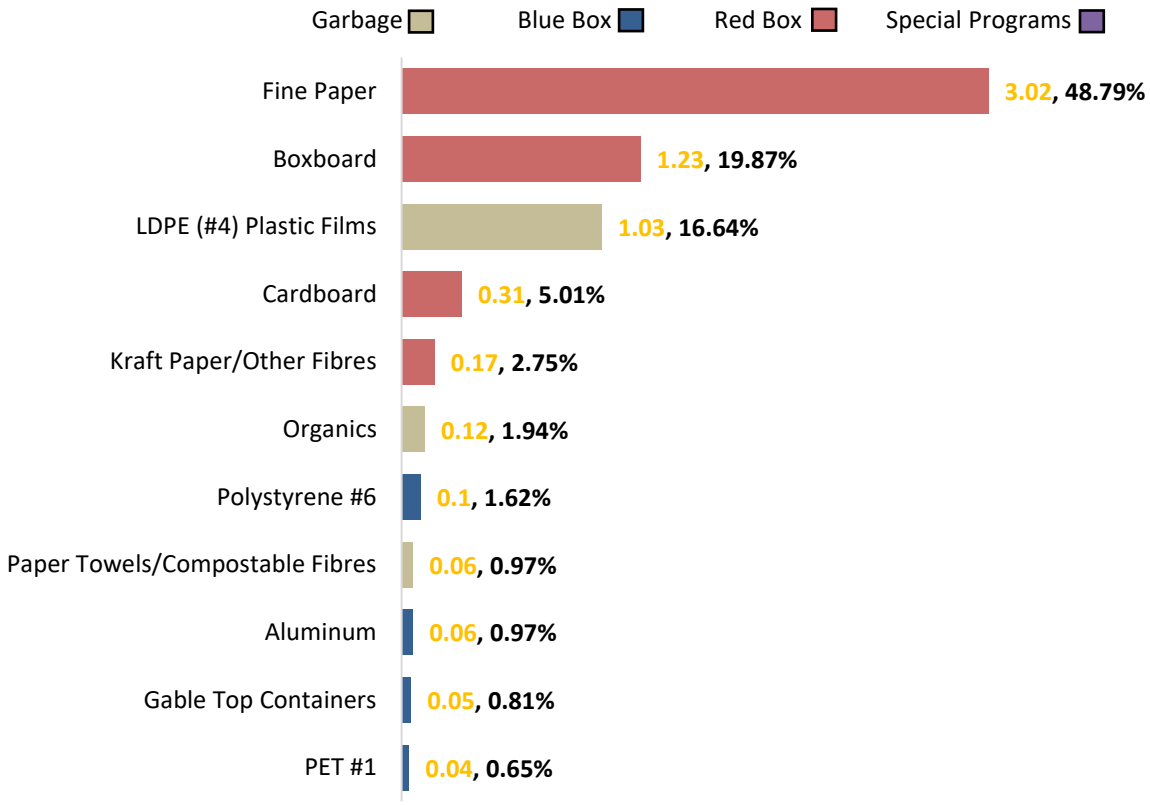

4.3.1 Red Box Sample

A total of 6.19 kg of Red Box material was collected and sorted during the audit. This material originated from hallways and general areas and accounted for 13.76% of the total sample mass. A detailed breakdown of the sample by material category is presented in Figure 5, and the corresponding contamination by generation area is illustrated in Figure 6.

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

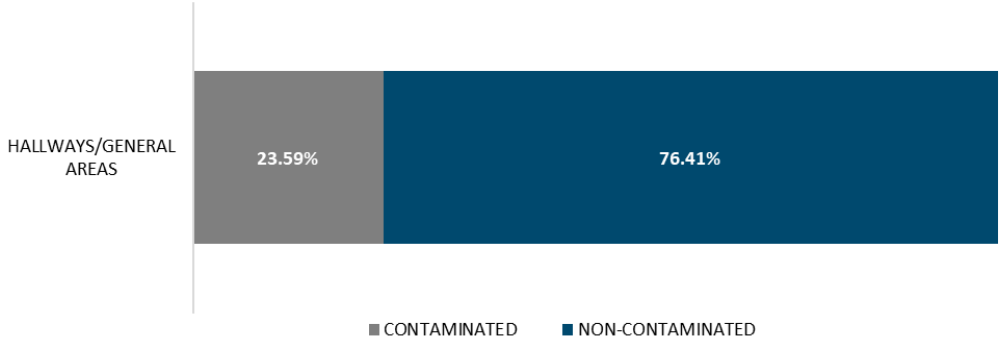

Figure 5: Red Box Composition by Material (in kg and % of sample by mass)

Notable Observations

- Within the Red Box stream, **fine paper was the highest material category generated**, accounting for approximately 48.79% of the total sample, followed by boxboard (19.87%) and LDPE #4 plastic films (16.64%).
- The remaining 14.70% was attributed to other material categories, including cardboard, kraft paper, organics, polystyrene #6, paper towels/compostable fibres, aluminum, gable top containers, and PET #1.
- The Red Box sample consisted of 76.41% Red Box material, 19.55% Garbage material and 4.04% Blue Box material.

Figure 6: Red Box Contamination by Generation Area

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

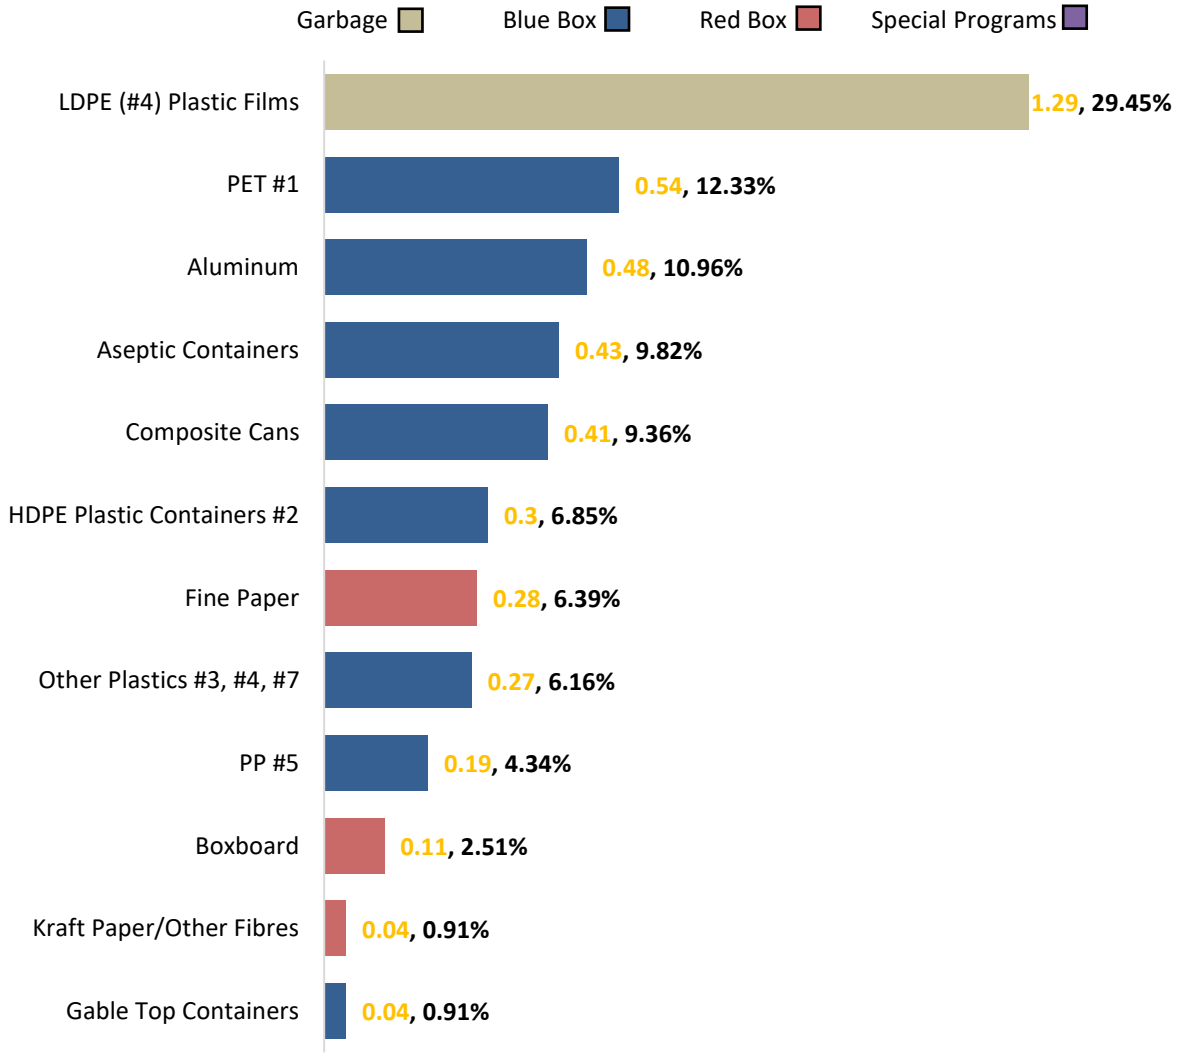

Notable Observations

- The contamination rate for the sampled Red Box stream was 23.59%. All the samples came from the hallways/general areas.
- The sample consisted of contamination of garbage (19.55%) and Blue Box materials (4.04%); the contamination was mainly from LDPE #4 plastic films, organics, and polystyrene #6.

4.3.2 Blue Box Sample

A total of 4.38 kg of Blue Box material was collected and sorted during the audit, representing 9.74% of the overall sample mass. The entire sample originated from the hallways/general areas. A detailed breakdown of the sample by material category is presented in Figure 7, and the corresponding contamination by generation area is illustrated in Figure 8.

Figure 7: Blue Box Composition by Material (in kg and % of sample by mass)

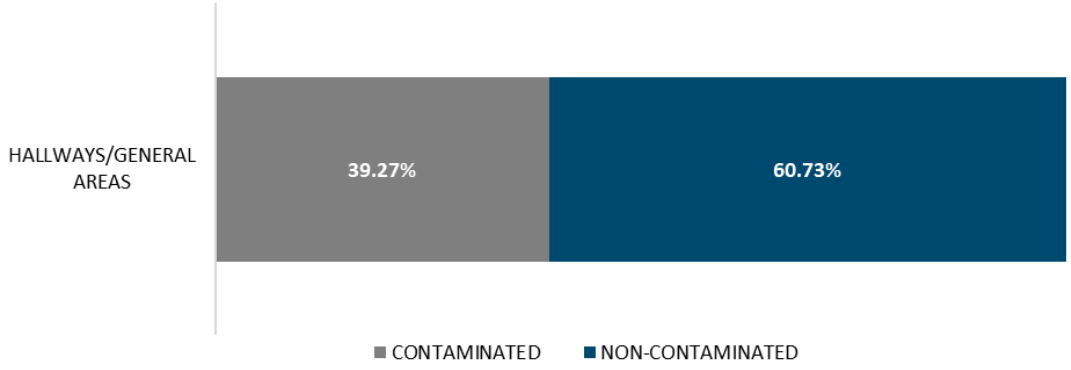

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

Notable Observations

- The Blue Box sample was primarily composed of **LDPE #4 plastic films**, which accounted for 29.45% (1.29 kg) of the total weight, followed by **PET #1** (12.33%) and **aluminum** (10.96%).
- The remaining 47.26% was attributed to other material categories, including additional container types (e.g., aseptic containers, composite cans, HDPE #2 containers, other plastics #3, #4, #7, PP #5 and gable top containers), and Blue Box materials (fine paper, boxboard, and kraft paper).
- The Blue Box sample consisted of 60.73% Blue Box material, 29.45% garbage material and 9.82% Red Box material.

Figure 8: Blue Box Contamination by Generation Area

Notable Observations

- The contamination rate for the sampled Blue Box stream was 39.27%. All samples were collected from hallways and general areas.
- The sample exhibited contamination from garbage materials (29.45%) and Red Box materials (9.82%), primarily consisting of LDPE #4 plastic films, fine paper, boxboard and kraft paper.

4.4 Recyclables in the Garbage Stream

Based on the waste sample composition analysis, Mandatory Recyclables and Other Recyclables were identified in the garbage stream. The garbage sample consisted of 12.38% Mandatory Recyclables, 12.18% Other Recyclables, and 75.44% Other (Non-Recyclable) material.

A description of the recyclable materials subject to O.Reg.103/94 is provided below.

Mandatory Recyclables

O. Reg. 103/94 mandates that Educational Institutions with more than 350 students enrolled during the calendar year must implement a source separation program for waste generated by their operations. As

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

part of this compliance, the establishment is required to implement a source separation program for the following materials, at a minimum:

- Aluminum food or beverage cans (including cans made primarily of aluminum);
- Cardboard (corrugated);
- Fine paper;
- Glass bottles and jars for food or beverages;
- Newsprint;
- Steel food or beverage cans (including cans made primarily of steel).

Other Recyclables

This includes any material eligible for recycling or that can be diverted from landfills. Other Recyclables include the following materials:

- Aseptic containers
- Batteries
- Boxboard
- Coffee Cups
- Composite Cans
- Electronics Waste
- Gable top containers
- HDPE #2 plastic containers
- Kraft paper/other fibres
- Lightbulbs
- Molded pulp
- Other plastics #7
- PET #1
- PP #5
- Printer toner/cartridges

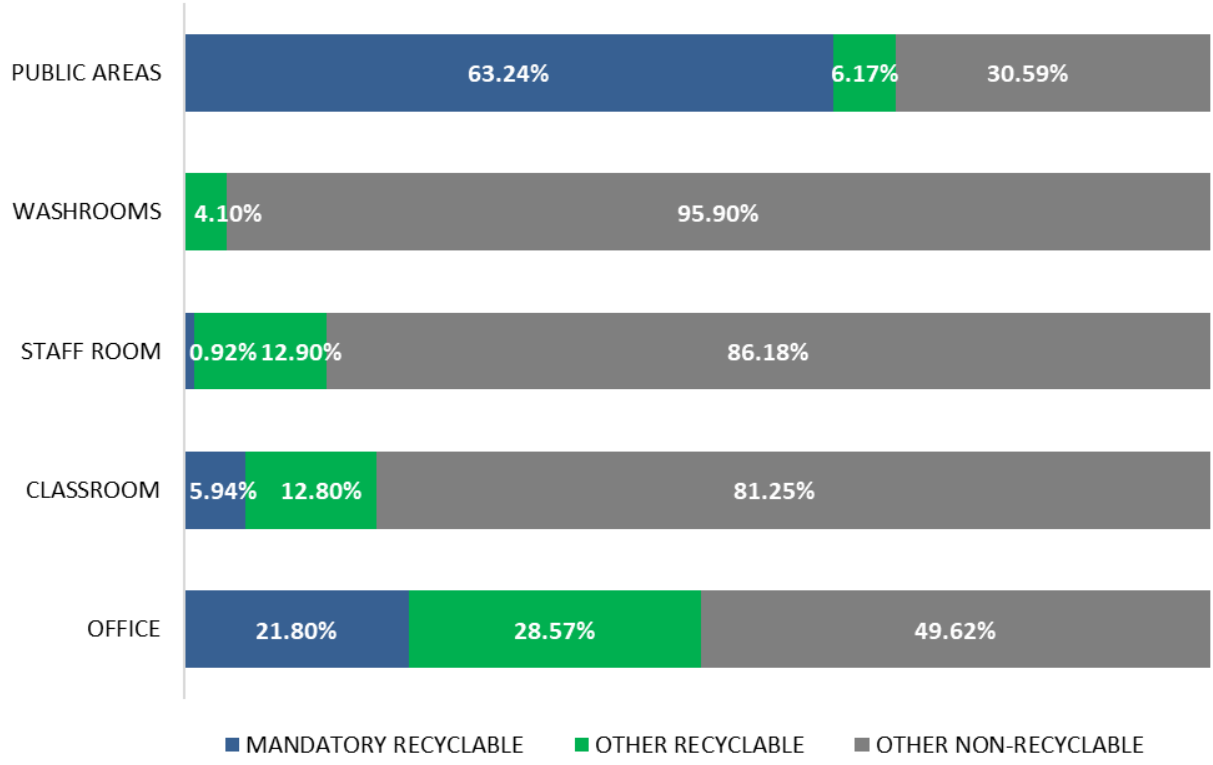

Other (Non-Recyclables)

Includes all other non-recyclable materials.

Below is an analysis of the garbage sample composition by material and material type (Mandatory Recyclables, Other Recyclables, and Non-Recyclables).

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

Figure 9: Ratio of Recyclables in the Garbage Stream by Generation Area

The breakdown of recyclables in the garbage stream by material is shown in the figures below.

Table 3: Breakdown of Mandatory Recyclables in Garbage Sample by Material (in kg and % of garbage sample mass)

Sampled Stream	Garbage	
O. Reg 103/04 Material	Estimated Annual Quantity Generated Through Garbage Stream (MT)	%
Fine Paper	0.75	45.92%
Aluminum	0.07	4.50%
Total	**0.83**	**50.41%**

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

Table 4: Breakdown of Other Recyclables in Garbage Sample by Material (in kg and % of garbage sample mass)

Sampled Stream	Garbage	
O. Reg 103/04 Material	Estimated Annual Quantity Generated Through Garbage Stream (MT)	%
Polystyrene #6	0.12	7.57%
HDPE Plastic Containers #2	0.12	7.46%
Aseptic Containers	0.12	7.22%
Boxboard	0.11	6.51%
PET #1	0.10	5.80%
PP #5	0.08	4.85%
Kraft Paper/Other Fibres	0.08	4.85%
Other Plastics #3, #4, #7	0.05	2.96%
Gable Top Containers	0.04	2.37%
Total	**0.81**	**49.59%**

Notable observations are discussed below:

- The garbage sample consisted of 12.38% Mandatory Recyclables, 12.18% Other Recyclables, and 75.44% Other (Non-Recyclable) material.
- Public areas exhibited the highest proportion of mandatory recyclables (63.24%) within the garbage, while the offices exhibited the highest proportion of other recyclables (28.57%). The washrooms exhibited the lowest proportion of mandatory recyclables at 0.00%.
- The Mandatory Recyclables in the garbage stream consisted of (in % of total sample mass):
    - Fine paper – 45.92%
    - Aluminum – 4.50%
- The Other Recyclables in the garbage stream consisted primarily of:
    - Polystyrene #6 – 7.57%
    - HDPE plastic containers #2 – 7.46%
    - Aseptic containers – 7.22%
    - Boxboard – 6.51%
    - PET #1 – 5.80%

5. Estimated Annual Quantities Generated

The annual quantity was calculated in metric tonnes (MT) using the following equation, based on 194 days in the school year and the sample mass generated over a one-day sampling period.

Estimated Annual Quantity = Number of days in school year x sample mass

Each material's estimated annual quantities were calculated and provided in the table below.

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

Table 5: Estimated Annual Quantities by Material

Material	Diverted Through Recycling (MT)	Disposed to Landfill through Garbage (MT)	Total Generated (MT)	%
Organics	0.00	2.24	2.24	25.68%
Fine Paper	0.59	0.81	1.39	15.96%
Paper Towels/Compostable Fibres	0.00	1.34	1.34	15.36%
LDPE (#4) Plastic Films	0.00	1.02	1.02	11.74%
Non-Recyclable	0.00	0.73	0.73	8.31%
Boxboard	0.24	0.13	0.37	4.20%
PET #1	0.10	0.10	0.21	2.38%
Aseptic Containers	0.08	0.12	0.20	2.31%
HDPE Plastic Containers #2	0.06	0.12	0.18	2.07%
Aluminum	0.09	0.09	0.18	2.05%
Polystyrene #6	0.00	0.14	0.14	1.65%
Kraft Paper/Other Fibres	0.03	0.09	0.12	1.38%
PP #5	0.04	0.08	0.12	1.33%
Coffee Cups	0.00	0.11	0.11	1.27%
Other Plastics #3, #4, #7	0.05	0.05	0.10	1.16%
Composite Cans	0.08	0.00	0.08	0.91%
Cardboard	0.06	0.00	0.06	0.69%
Gable Top Containers	0.01	0.05	0.06	0.64%
Textiles	0.00	0.05	0.05	0.53%
PPE	0.00	0.02	0.02	0.20%
Cold Beverage Wax-Lined Paper Cups	0.00	0.02	0.02	0.18%
Batteries	0.00	0.00	0.00	0.00%
Bubble Wrap/Shrink Wrap	0.00	0.00	0.00	0.00%
Electronic Waste	0.00	0.00	0.00	0.00%
Glass	0.00	0.00	0.00	0.00%
Lightbulbs	0.00	0.00	0.00	0.00%
Moulded Pulp	0.00	0.00	0.00	0.00%
Newspaper	0.00	0.00	0.00	0.00%
Other Metal	0.00	0.00	0.00	0.00%
Other Organics	0.00	0.00	0.00	0.00%
Other Wood	0.00	0.00	0.00	0.00%
Plastic Strapping	0.00	0.00	0.00	0.00%
Printer Toners	0.00	0.00	0.00	0.00%
Shredded Paper	0.00	0.00	0.00	0.00%
Steel Cans	0.00	0.00	0.00	0.00%
Styrofoam	0.00	0.00	0.00	0.00%
Total	**1.43**	**7.29**	**8.73**	**100.00%**

Notable Observations are discussed below:

- 8.73 MT of material are expected to be generated annually, which consists primarily of the following materials:
    - Organics – 2.24 MT
    - Fine paper – 1.39 MT
    - Paper towels/compostable fibres – 1.34 MT

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

- LDPE #4 plastic films – 1.02 MT

6. Performance Metrics

6.1 Waste Diversion Rate

Waste diversion is the percentage of waste materials a facility diverts from landfills due to reducing, reuse and recycling (3Rs) programs versus the total amount of waste generated (3Rs plus landfill waste). The Ministry of the Environment, Conservation and Parks defines the Waste Diversion rate calculation as follows:

$$Waste\ Diversion\ Rate = \frac{Total\ Waste\ Diverted\ (3Rs)}{Total\ Waste\ Generated} \times 100$$

Where,

Total Waste Diverted (3Rs) = 2.05 MT

Total Waste Generated = 8.73 MT

$$Waste\ Diversion\ Rate = \frac{2.05\ MT}{8.73\ MT} \times 100$$

Waste Diversion Rate = 23.50%

The total waste diverted (2.05 MT) represents the estimated quantity of material sent to recycling, calculated by multiplying the audited Red Box and Blue Box material quantities by the number of operational days. This figure includes all materials present in the recycling streams, including items that were incorrectly placed.

Beacon Heights Public School's waste diversion rate was calculated to be 23.50% (below the provincial objective of 60%) based on 2.05 MT of potential diverted waste and 8.73 MT of total waste generated in 194 school days.

6.2 Capture Rate

The capture rate is the proportion of divertible waste materials successfully diverted from disposal compared to the total amount of divertible waste materials generated. It measures the effectiveness of existing recycling programs.

The Recycling Council of Ontario defines the Capture Rate calculation as follows:

$$\text{Capture Rate} = \frac{\text{Total Divertible Material Captured (3Rs)}}{\text{Total Divertible Material Generated}} \times 100$$

Below are the capture rates for all divertible materials included in existing waste diversion programs at the Site.

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

Table 6: Capture Rates for Diversion Programs

Stream	Diverted (MT)	Landfill Quantity (MT)	Total Generated (MT)	Capture Rate
Overall Recycling	**1.43**	**1.88**	**3.32**	**43.24%**
Red Box	0.92	1.13	2.05	44.75%
Blue Box	0.52	0.75	1.26	40.80%
Special Programs	0.00	0.00	0.00	0.00%
Total	**1.43**	**1.88**	**3.32**	**43.24%**

In the capture rate, the diverted quantity represents the estimated amount of divertible material correctly placed into the appropriate recycling streams. It was calculated by multiplying the audited Red Box and Blue Box quantities by the number of operational days and includes only materials that were properly disposed, excluding any incorrectly placed items. Conversely, the landfill quantity represents all divertible materials that were incorrectly disposed of in the garbage stream.

The overall **capture rate was calculated at 43.24%,** based on a total diverted quantity of 1.43 MT and a total potential divertible quantity of 3.32 MT. The overall recycling capture rate was 43.24%, with the Red Box and Blue Box capture rates calculated at 44.75% and 40.80%, respectively.

7. Waste Audit Summary and Waste Reduction Work Plan

Refer to Appendix F for the Waste Audit Summary and the Waste Reduction Work Plan.

According to O.Reg.102/94, the Waste Reduction Work Plan or a plan summary must be posted at the facility where employees can review it. If a summary is posted, the entire Work Plan should also be made available for review by any employee upon request.

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

8. Findings and Conclusions

The conclusions discussed below are based on the waste audit findings. It should be noted that the conclusions and recommendations provided in this report are based on the waste audit sample results, which are considered representative of the annual quantities for this report. The estimates in this report have yet to account for fluctuations in waste quantities generated daily.

- The Garbage stream sample had the highest sample mass (76.50%), followed by Red Box (13.76%) and Blue Box stream (9.74%).

Overall Composition

- Classrooms accounted for the largest share of the sample (55.74%), primarily from the garbage stream, composed mainly of organics, paper towels/compostable fibres and non-recyclables.
- Hallways and general areas generated the second-highest sample mass (23.50%), with the largest contribution from the Red Box stream (13.76%).
- Overall, organics, fine paper, paper towels/compostable fibres, and LDPE #4 plastic films were the most generated materials across all areas and waste streams, collectively accounting for roughly 69% of the total sample mass.

Composition by Waste Stream

- The garbage stream was primarily composed of organics (33.22%), followed by paper towels/compostable fibres (19.91%), and fine paper (11.28%).
    - The Garbage sample consisted of 73.79% garbage material, 15.72% Red Box material, and 10.49% Blue Box material.
- Within the Red Box stream, fine paper was the dominant material at 48.79%, followed by boxboard (19.87%) and LDPE #4 plastic films (16.64%).
    - The Red Box stream was composed of 76.41% Red Box material, 19.55% Garbage material and 4.04% Blue Box material.
- The Blue Box stream was primarily composed of LDPE #4 plastic films (29.45%), PET #1 (12.33%), and aluminum (10.96%).
    - The Blue Box stream consisted of 60.73% Blue Box material, 29.45% garbage material and 9.82% Red Box material.

Contamination

- The garbage stream exhibited a contamination rate of 26.21%, while the overall recycling stream showed a contamination rate of 23.65%; contamination rates for the Red Box and Blue Box streams were 23.59% and 39.27%, respectively.
- The overall contamination rate for the garbage stream was 26.21%, indicating notable misplacement of recyclable materials.

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

  - Contamination within the garbage stream included 15.72% Red Box material, and 10.49% Blue Box material, with fine paper, mixed containers (polystyrene #6, HDPE #2 containers, aseptic containers), coffee cups and boxboard as the main contaminants.
  - The garbage sample showed that Classrooms (55.10%) were the most contaminated among all generation areas. The contamination consisted primarily of fine paper, boxboard and polystyrene #6. The washrooms showed the lowest contamination at 0.89%.
- The contamination rate for the Red Box stream from hallways and general areas was 23.59%, largely attributable to mis-sorted garbage. Contamination consisted primarily of garbage (19.55%) and Blue Box materials (4.04%), with LDPE #4 plastic films, organics, polystyrene #6, paper towels/compostable fibres, and aluminum identified as the predominant contaminants.
- The contamination rate for the Blue Box stream was found to be 39.27% from hallways and general areas. Contamination was associated with garbage materials (29.45%) and Red Box materials (9.82%), primarily consisting of LDPE #4 plastic films, fine paper, boxboard and kraft paper/other fibres.

Mandatory Recyclables

- The garbage stream consisted of 12.38% mandatory recyclables, 12.18% other recyclables, and 75.44% non-recyclable materials.
- Public areas demonstrated the highest proportion of mandatory recyclables disposed of as garbage (63.24%), while the offices exhibited the highest proportion of other recyclables (28.57%). The washrooms showed the lowest proportion of mandatory recyclables disposed of as garbage at 0.00%.
- Mandatory recyclables disposed of in the garbage stream were primarily fine paper (45.92%) and aluminum (4.50%).
- Other recyclables in the garbage stream consisted mainly of polystyrene #6 (7.57%), HDPE plastic containers #2 (7.46%), aseptic containers (7.22%), boxboard (6.51%), and PET #1 (5.80%).

Estimated Annual Quantities

- An approximate of 8.73 MT of waste is estimated to be generated annually in Beacon Heights Public School, dominated by organics (2.24 MT), fine paper (1.39 MT), paper towels/compostable fibres (1.34 MT), and LDPE#4 plastic films (1.02 MT).

Waste Diversion Rate

- The 2025 **waste diversion rate was calculated to be 23.50%** (below the provincial objective of 60%) based on 2.05 MT of diverted waste and 8.73 MT of total waste generated in 194 school days.

Capture Rate

- **The overall capture rate was calculated at 43.24%,** based on an estimated total diverted quantity of 1.43 MT and a total potential divertible quantity of 3.32 MT. The overall recycling capture rate was 43.24%, with the Red Box and Blue Box capture rates calculated at 44.75% and 40.80%, respectively.

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

9 Recommendations

Based on the conclusions, the following recommendations are tied to the conclusions discussed in the previous section.

9.1 Improve Existing Waste Diversion Programs

Improving the following existing diversion programs could improve waste diversion and capture rates.

Mandatory Recyclables

- **Fine paper — 0.75 MT** of material is estimated to be generated annually through the garbage stream. Diverting this through the recycling stream could **increase the waste diversion rate up to 6.05%** and **could increase the capture rate up to 22.62%.**
- **Aluminum — 0.07 MT** of material is estimated to be generated annually through the garbage stream. Diverting this material through the recycling stream could **increase the waste diversion rate up to 0.61%** and **could increase the capture rate up to 2.11%.**

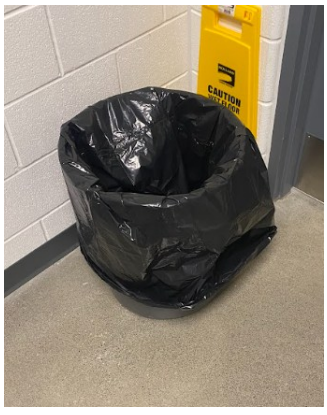

9.2 Add Organics/Paper Towels Diversion Programs

- Organics generated in the garbage stream accounted for 2.24 MT of material annually. Diverting this material through a new organics diversion program **could increase waste diversion by up to 15.63%**.
- Paper towels generated in the garbage stream accounted for 1.34 MT of material annually. Diverting this material through a new organics diversion program **could increase waste diversion by up to 10.18%**.

9.3 Dedicated Receptacles and Update Signage

Waste diversion rates could be improved by implementing dedicated receptacles with clear signage to encourage waste separation at the source. Some rogue bins are located throughout the school, with no signage or consistency with size and colour (Image 1 & 2).

Image 1& 2 Current bins and signage

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

- Dedicated receptacles for waste, including landfills, organics/compost, and mixed recyclables, should be implemented as part of collection programs. Receptacles should be sized appropriately according to their use and colour-coordinated to identify the type of waste (i.e., green for organics/compost, blue for recycling, black for garbage).

- Remove every "solitary" garbage container from the building. The implementation of multi-compartment recycling bins is advised. This will increase source separation and overall diversion rates, especially in common areas, which will also allow staff to specifically seek out a multi-streamed bin.

- Clear plastic garbage bags rather than black plastic bags should be used to gather all waste products. This enables the maintenance team to monitor garbage collection and ensure that different waste streams are disposed of in the appropriate containers.

- Implement clear signage for each bin explaining the type of waste to be disposed of will guide the viewer's gaze, and promote coherence in the waste disposal throughout the facility while presenting the information in a quick, digestible manner.

An example of dedicated, colour-coded receptacles and signage is provided below.

Image 3 & 4: Recommended Signage and bins

9.4 Promoting Culture

- A committee is recommended to oversee waste reduction and sustainability and promote a culture of waste diversion. Educate staff and students on the importance of waste diversion and communicate the corporate goals for waste diversion and sustainability. Create a positive message around the benefits of waste diversion and the individual's role.

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

- Support and promote the procurement and use of environmentally friendly, reusable, or recyclable materials and packaging, including products with recycled content. For example, prioritize the purchase of coffee pods that participate in a collection and recycling program to ensure proper disposal.
- Encourage staff to prioritize bringing reusable containers, water bottles, and coffee cups.
- Ensure an Environmental Policy is visible in common areas throughout the building and continue to emphasize the facility's commitment to environmental stewardship through its training program and green or environmental initiatives.
- Promote and highlight current environmental programs and efforts through newsletters, posters, and/or bulletin boards for waste management.

9.5 Continuous Monitoring and Process Improvement

Track year-over-year changes in waste diversion capture rates and communicate progress to staff and students to encourage further participation/engagement.

Continuous monitoring and reporting for this site annually and comparison with year-over-year changes would provide insight into trends, which can be used as a basis for policy decisions regarding solid waste management for future projects. Further refinements to programs/processes can be made, and adherence to provincial requirements can be achieved. Such programs may include wood pallet reuse, electronic waste recycling, bulbs & ballasts, batteries, printer toner reuse, double-sided printing policy, textiles donation and other programs.

Appendices

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

Appendix A: List of Categories

Material Category	Description
1. Paper and Paper Products	
Fine Paper	Includes mixed fine papers, writing paper, office paper, copy paper, bills and statements, ad mail, lottery tickets, receipts, envelopes, promotional cards, promotional calendars, printed information found within packaged products, etc. ● Also includes softcover books, booklets, magazines, catalogues, calendars, flyers, and inserts.
Newsprint	Major daily and weekly newspapers and community newspapers. Does not include flyers and inserts.
Shredded Confidential Papers	Any paper that has been shredded.
Boxboard	Single-layered paperboard and fibre board with no corrugation. This includes cereal boxes, shoe boxes, cores from toilet paper, paper towels, gift wrap, etc.
Kraft Paper	Kraft paper bags and wrap, grocery or retail bags, potato bags, pet food bags, etc. Includes brown, white, and coloured kraft paper and bags. No bags with bonded plastic or foil lining.
Corrugated Cardboard	Waxed or unwaxed corrugated cardboard containers. Includes moulded pulp materials such as egg cartons, drink trays, other trays, etc.
Gable Top Containers	Polycoat containers with a gable-shaped top are used for milk, juice, some foods, etc.
Aseptic Containers	Tetra-pak-type polycoat packaging containers are used for juice, milk, soups and broths, alternative milk beverages, and alcoholic beverages.
Composite Cans	Spiral-wound cans with paper walls and plastic or metal tops or bottoms. They contain frozen juice, Pringles chips, dough, some raisins, etc.

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

Coffee Cups	All cups and containers used for hot/cold beverages and food (without a plastic oHot Primarily, hot/cold food and beverage containers are common in the fast food industry. Includes paper-based cups with a plastic lining, water cooler cups, freezer boxes, etc.
2. Plastic	
#1 Polyethylene Terephthalate (PET)	All PET #1 plastics. This includes clear or coloured thermoform packaging, beverage bottles, and non-beverage bottles used for food and non-food items such as dish soap, shampoo, mouthwash, window cleaner, and floor cleaner. ● Does not include Black Plastics.
#2 High-Density Polyethylene (HDPE)	All HDPE #2 plastics. Includes natural and coloured bottles, jugs, and containers for beverages, food items, and non-food items such as laundry soap, shampoo, bleach, vinegar, pill bottles, etc. ● Does not include Black Plastics.
#4 Low-Density Polyethylene (LDPE) Films	All #4 LDPE plastic films. This includes soft, "stretchy" PE plastic used for items such as produce bags, water bottle overwraps, garbage bags, kitchen liners, blue or clear recycling bags, sandwich and freezer bags, etc. ● Does not include Black Plastics.
#5 Polypropylene (PP)	All #5 PP plastics. Includes clear and coloured food containers, jugs, jars, take-out beverage cups, bottles, and jars for food items. ● Does not include Black Plastics.
#6 Non-Expanded Polystyrene (PS)	All Non-Expanded (rigid) #6 PS plastics. Includes clear or coloured rigid food trays, clamshells, cup lids, yogurt cups, CD and DVD cases only (no disk), etc. ● Does not include Black Plastics.
Other Recyclable Plastics (#3, 4, 7)	All other recyclable plastics (#3, 4, 7). Includes clear and coloured bottles, jugs, jars, and containers.
3. Glass/Metal	

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

Glass:	All clear and coloured glass. Includes bottles and containers for food, beverages, cosmetics, toiletries, household pharmaceutical products, candle jars, etc. ● Does not include non-recyclable glass such as windowpane glass, plates, drinking glasses, figures, or incandescent light bulbs.
Aluminum	All aluminum containers and foils. Includes food and beverage containers, rigid aluminum trays (pie plates, baking trays, etc.), empty aerosol containers, and containers for hair products, tubes, etc. ● Does not include full or partially full pressurized cans.
Steel	All steel containers. Includes food and beverage containers, empty spray cans (for cooking oil, whipped cream, etc.), and empty paint cans. ● Does not include full or partially full pressurized cans.
4. Organics	
Organic Food Waste	All edible and non-edible organic waste from food items. Includes untouched and leftover bakery, meat & fish, dried food, fruits & vegetables, dairy, and other foods.
Other Organics:	All other organic materials that are not derived from food items. Includes yard waste, grass clippings, small wood waste, pet waste, diapers and sanitary products, certified compostable plastic bin liners, and other compostable papers.
Compostable fibres	Include paper towels, paper napkins, toilet paper, facial tissues, etc.
5. Operational waste	
Other metals,	Scrap metals, copper pipes, hardware, etc. Includes multi-material items that are mainly metal.
Non-Treated Wood	Non-treated wood materials. Includes skids/pallets, wooden furniture, etc. ● Does not include branches, brush, or wood chips.

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

Batteries	All single-use and rechargeable batteries. Includes Alkaline-Manganese, Lithium, Silver Oxide, Zinc Air, Zinc-Carbon, etc.
Printer Toners	All ink cartridges and printer toners.
E-Waste	All waste is from electrical and electronic equipment (WEEE). Anything that is battery-operated and/or can be plugged into an electrical outlet. Includes computer/IT equipment, telecom equipment, TV & audio equipment, small kitchen appliances, wires/chargers /adapters, cocks, gadgets, etc.
Plastic Strapping	This is All-Plastic Strapping material. It is used to bundle products for retail sales and can come in various colours and plastic materials.
6. Non-Recyclable Waste	
Non-Recyclable/Garbage	All other non-recyclable waste materials are not classified elsewhere. Includes hazardous waste, coffee cups, black plastics, and expanded polystyrene, all described below. Includes chip bags, furnace filters, laminated papers, rigid or durable plastics, non-recyclable glass, dust, single-use cleaning wipes, single-use coffee pods, plastic straws and cutlery, materials too small to process, etc.
Hazardous Wastes	All hazardous wastes are not classified elsewhere. Includes full or partially full pressurized cans, paints, and oil containers. ● Also includes fluorescent light bulbs and tubes, medical sharps and syringes, mercury-containing devices, pharmaceuticals, antifreeze, fertilizers, solvents, pesticides, etc. ● Also includes all other liquid or non-liquid items with signal words such as "Poison," "Danger," "Warning," "Caution," and "Precautionary Statements."
Cold Beverage Wax-Lined Cups	All cups and containers have a plastic or wax lining. Multiple-layered, primarily fibre, hot/cold food and beverage containers are common in the fast food industry. This includes paper-based cups with a plastic lining, water cooler cups, freezer boxes, etc.

Copyright © 2023 Waste Reduction Group Inc. All Rights Reserved. Created in Ontario, Canada.

Black Plastics	Includes all Black Plastics #1-7 and unmarked. ● Also includes rigid, durable, and expanded Black Plastics and black plastic bags.
Expanded Polystyrene	This includes white, coloured, and black polystyrene foam packaging for food trays, clamshells, etc., as well as foam packaging for "peanuts" and foam blocks used to protect boxed products.
